PHISHING Summary

In this scenario I wanted to assess the efficacy of cybersecurity training on Phishing attacks.

I cloned the login website http://testfire.net/login.jsp and used a PHP script to capture login credentials.   I set the cloned website up on a WOMP server so that any link would not go back to a company URL but an IP address. Then I crafted an email with the malicious link and emailed it out to all employees from a similar but spoofed email address. The email prompted employees to verify login credentials.

A log was produced with employee login credentials on any employee who clicked the link and followed the prompts.
